

A One-minute selected intersection

Selection-model AUROC: 0.856

Effective sample size after weighting: 609.4

Maximum key absolute SMD after weighting: 0.122

R1 completeness was strongly predictable. The intersection is a selected subset, not an interchangeable minute-resolution validation cohort.

B Prespecified IPW stop rules

TRIGGERED	ESS below 50 percent of intersection	609.356 / 744.000
TRIGGERED	key post weight absolute SMD above 0.10	0.122 / 0.100
PASS	practical positivity failure	0.000 / 0.010
PASS	more than 5 percent propensities clipped	0.001 / 0.050

Because effective-sample-size and residual-balance gates failed, weighted R1 estimates remain exploratory and cannot transport minute-resolution findings to all 7,177 patients.
